Summary

7th-semester Computer Science undergraduate and AI Solutions Developer Intern. Experienced in building mobile and web applications in Java, Kotlin, JavaScript, and Dart, with a backend focus on PostgreSQL and SQLite data design. Built a native Android service with on-device ML inference, and a multi-tenant manufacturing prototype with row-level security. Seeking a 6-month engineering internship, January–June 2027, in edge AI or embedded/automotive systems.

Education

Presidency University — Bangalore, India
Bachelor of Technology in Computer Science and Engineering (Pursuing); CGPA: 8.20 — *Expected May 2027*

Experience

AI Solutions Developer Intern — October 2026 – Present
Saina Human AI Pvt. Ltd. — *Remote*

- Develop AI-powered solutions and automation pipelines, integrating the Gemini API and Groq LPU to architect LLM routing workflows and Telegram webhooks.
- Evaluate and implement emerging AI models for internal tools, collaborating across technical teams to deploy production-ready proofs-of-concept.

Projects

Garment ERP: Multi-Tenant Manufacturing SaaS — September 2026
Next.js, Supabase, Gemini API, jsPDF | GitHub: Garment_ERP

- Built a multi-tenant manufacturing SaaS with PostgreSQL row-level security across 19 tables and security-definer functions to isolate tenant data.
- Implemented 3-tier role-based access control with Next.js middleware session checks, blocking unauthorized routes and API access.
- Built an apparel manufacturing pipeline covering BOM, inventory thresholds, cutting, stitching, QA defect audits, and dispatch invoicing, plus bulk CSV/Excel import and paginated PDF export.
- Integrated the Gemini API to automate QA defect analysis.

Online Blockchain Certificate Generation and Validation System — Aug. 2026 – Oct. 2026
Solidity, Ethers.js, Next.js, Supabase, Python, Flask | GitHub: certchain-blockchain-verification

- Deployed a Solidity contract on the Ethereum Sepolia testnet (view on Etherscan) with issuer-only access control, Keccak-256 credential hashing, and an on-chain audit trail for issue, suspend, and revoke actions.
- Built a Flask service that screens uploaded marksheets for tampering using Error Level Analysis, OCR grade cross-checks, and institution-name validation before a certificate is issued.
- Built a Next.js and Supabase app that generates certificate PDFs with embedded QR codes and a public verification page that reads credential status directly from the blockchain.

Intent: Edge-AI Notification Firewall — Apr. 2026 – Oct. 2026
Kotlin, Flutter, SQLite, TensorFlow Lite | GitHub: intent-attention-firewall

- Rebuilt from scratch in 2026 for the Google Solutions Challenge: a native Android background service in Kotlin that classifies system notifications with no cloud APIs or data transmission.
- Deployed an on-device LSTM model via TensorFlow Lite, keeping all data local to the device.
- Optimized memory allocation and SQLite queries to reach 3.68ms warm inference latency under Android 14 background execution limits.

Honors & Achievements

2nd Place, Project Exhibition | *Presidency University* — Nov. 2025

- Secured 2nd place for an earlier **Intent** prototype, built solo, against 50+ multi-member development teams.

Technical Skills

Languages: Java, Kotlin, Dart, JavaScript, HTML/CSS

Frameworks & Tools: Next.js, React, Flutter, Android SDK, Git, Android Studio

Backend & Databases: Supabase, PostgreSQL (RLS), SQLite, Firebase Firestore, REST APIs

ML & Edge: TensorFlow Lite, LSTM, on-device inference
